

Terraform vs Azure CLI - Beginner Notes

This document explains the basic difference between **Azure CLI** and **Terraform** in simple English. It also explains how Terraform works for creating Azure resources like Resource Groups and Storage Accounts.

Jis tarike se humne Azure CLI ke through RG and Storage account banaya

What is Terraform?

Point	Explanation
Created By	Terraform was created by HashiCorp.
Acquired By	IBM acquired HashiCorp.
Programming Language	Terraform is built using Go Language.
Configuration Language	We write Terraform code in HCL (HashiCorp Configuration Language).
Open Source	Terraform is open source and available on GitHub.
Type of Tool	Terraform is a declarative Infrastructure as Code (IaC) tool.

Steps to Create Resources Using Azure CLI

- Install Azure CLI.

- Run az login command.
- Your Azure account must have contributor access on the subscription.
- Write Azure CLI commands.
- Run the commands in terminal.
- Azure Resource Group or Storage Account gets created successfully.

Steps to Create Resources Using Terraform

- Install Terraform.
- Create a .tf file (Example: chameli.tf).
- Write Terraform configuration code.
- Run az login to authenticate Azure account.
- Run terraform init.
- Run terraform plan.
- Run terraform apply.
- Terraform automatically creates the Azure Resource Group.

Why Terraform is called Declarative?

In Terraform, we only describe **what we want**. Example: "Create one Azure Resource Group."

Terraform automatically decides **how to create it** internally.

Sample Terraform Code

```
resource "azurerm_resource_group" "example" { name = "demo-rg" location = "Central India" }
```

Terraform helps automate infrastructure creation in a simple and reusable way. It is widely used in DevOps and Cloud projects.
